Diagnosis of Issues / Damage :

MAINBOARD DAMAGED DEVICE

Upon inspection, the motor controllers (ESC Board) has failed to perform in some of our tests indicating erratic signals which lead to a motor speed failure/unprecise rotation.

Drone self check shows errors as motor idle or drifting. Trying to fly this drone might pose a risk of failure during flight causing the drone to collapse and fall from the sky.

Repair and or Replacement recommendations:

BEYOND ECONOMIC REPAIR: **Replacement device recommended**

Based on the damage found not only at the arm but also on the mainboard controllers any attempt of repairing this drone is a potential risk (failing while flying), repair this drone is not recommended and won't guarantee reliability performance as expected by manufacturer specifications.
